
BAPE-4.9

Référence:

4. Le climat sonore

Demande ou Question:

- 4.9 Est-ce qu'un tableau existe pour le récepteur A1 comme dans le rapport principal de l'étude d'impact, tableaux 5.4-10 à 12 ?

Réponse:

A table that rates the level of impact at location A-1 cannot be developed as noise criteria specific to the type of activities in the area have not been established. This is why impacts on birdwatching were discussed qualitatively in the EIS.

No criteria based on an activity dependant on wildlife could be identified, nor are there quantified noise criteria for birds. MDDEP does have criteria for parks, however the type of park intended by the regulation relates more to places such as playgrounds or sports fields (places where people gather and tend to generate noise). The World Health Organization (WHO) does state that the ratio of intruding noise to natural background levels for conservation areas should be kept low, but no values are quantified.
