

A man once said "The Earth does not belong to man; Man belongs to the Earth." It is from this perspective that I come to you, a single man of the Earth. Terms like borders, race, and nationalism are insignificant in the grander scheme of things that is planet earth. One term that *should* be relevant as a commune human race concerned with the wellbeing of this planet is sustainability.

The world is simply too dependent on oil, a consumable and exhaustible resource. It's a resource that has repercussions on the world through carbon emissions and subsequent climate change. It's disappointing to think that with all the technology readily available to help stop climate change and we're stuck at political stand stills around the world on why not to do it. Simply put, human potential as a community is halted by our own selfishness, and it is that which we must overcome. Not only for a clean self-sustaining planet, but so that humankind might focus attention on what it could accomplish rather than solving problems it created.

Thus we arrive at the wind farm project. Wind energy is a clean sustaining energy source. It consumes no fuel, produces practically no carbon emissions except for its initial construction, which it works off in months. Should the project go through? Of course it should. We're not only talking about one town, but overall influence for the world to change. It all starts here and now. I part you with a quote from Stewart Udall "Plans to protect air and water, wilderness and wildlife are in fact plans to protect man."
